
IN THE FOURTH DISTRICT COURT - ALL DEPARTMENT
IN AND FOR UTAH COUNTY, STATE OF UTAH

AFFIDAVIT FOR SEARCH WARRANT

STATE OF UTAH)
 :SS
County of Utah)

The undersigned affiant, Detective MICHAEL GEORGE CARLE of Utah County Sheriff's Office, upon an oath or written affidavit subscribed under criminal penalty, declares:

That your affiant has reason to believe:

THAT

On the item(s) described as:

Moto G play, serial #ZY22JCM33 belonging to George Zinn DOB 04/03/1954.

In the City of Provo, County of Utah, State of Utah, there is now certain property or evidence described as:

1. Images or visual depictions of child sexual abuse material (CSAM);
2. Images or depictions, whether written or visual, of child erotica;
3. Electronic information (including notes, software, documents, records, or correspondence, in any format and medium) pertaining to CSAM, child erotica, sexual activity with minors, attempts to have sexual activity with minors, or sexual interest in minors;
4. Electronic information (including notes, software, documents, records, or correspondence, in any format and medium) pertaining to any minor who is, or appears to be, the subject of any visual depiction of CSAM, child erotica, sexual activity with other minors or adults, or sexual interest, including any information that may be helpful in identifying such minors;
5. Evidence of the identity of the person in possession of the Subject Device(s) on or about any times that items of evidentiary value (including user attribution evidence), located

pursuant to this warrant, were created modified, accessed, or otherwise manipulated. Such evidence may be found in digital communications, photos and video and associated metadata, documents, social media activity, and/or electronically stored information from the device necessary to understand how the device was used, the purpose of its use, who used it, and when;

6. Electronic information (including documents, records, photos, videos, or correspondence, in any format and medium) that pertain to use or ownership of the Subject Device(s), or that aid in the identification of persons involved in distributing, receiving, possessing, storing, or viewing CSAM;

7. Evidence of when and where the Subject Device(s) was used, including descriptions of time, date, locations, items, or events, that show or tend to show the commission by a particular person of, or connect or tend to connect a particular person to, distributing, receiving, possessing, storing, or viewing CSAM;

8. Evidence of who used, owned, or controlled the Subject Device(s) to commit or facilitate the commission of the crimes described, or at the time the things described in this warrant were created, edited, or deleted [including photographs, videos, logs, call logs, phonebooks, address books, contacts, IP addresses, registry entries, configuration files, saved usernames and passwords, documents, calendars, browsing history, search terms, metadata, user profiles, e-mail, e-mail contacts, messages (text or voice), instant messaging logs, file structure and correspondence];

9. Evidence of other accounts associated with the Subject Device(s) including email addresses, social media accounts, messaging “app” accounts, online storage accounts, and other accounts that may be accessed through the device that will aid in determining the possessor/user of the device;

10. Electronic information (including records, documents, invoices, materials, in any format and medium) that concern usernames, email addresses, e-mail accounts, other online accounts, online storage, or other remote computer storage pertaining to distributing, receiving, possessing, storing, or viewing CSAM.

11. Evidence of the attachment to the Subject Device(s) of other storage devices or similar containers for electronic or digital evidence; and/or evidence that the Subject Device(s) was attached to any other device(s);

12. Evidence of use of the Subject Device(s) to communicate with other individuals with a sexualized interest in minors or others about the crime(s) listed below, via incoming or outgoing calls, chat sessions, instant messages, text messages, app communications, social media, SMS communications, or other similar digital communications related to the sexual abuse of a minor or the possession or production of depictions of minors engaged in sexually explicit conduct;

13. Electronic information (including address books, names, addresses, phone logs, and text logs, in any format and medium) of individuals who may have been contacted by use of the Subject Device(s) or by other means for the purpose of distributing, receiving, possessing, storing, or viewing CSAM;

14. Electronic information (including notes, software, documents, records, or correspondence, in any format and medium) concerning membership in online groups,

clubs, or services that provide or make accessible CSAM, or offer children for sexual encounters;

15. Electronic information (including records, documents, invoices and materials, in any format and medium) that concern any accounts with an Internet Service Provider or Cellular Telephone Service pertaining to distributing, receiving, possessing, storing, or viewing CSAM;

16. Credit card information, bills, and payment records on subjects device pertaining to distributing, receiving, possessing, storing, or viewing CSAM;

17. Information regarding the telephone number associated with any seized phone(s), its service provider and all data used by a service provider to identify the phone, including the phone's IMED, ESN or other serial number, MAC address, and other unique identifiers;

18. Information that can be used to calculate the position of any seized phone during the date range of 9/10/2024-09/10/2025, including location data; cell tower usage; GPS satellite data; GPS coordinates for routes and destination queries between the above-listed dates; "app" data or usage information and related location information; and images created, accessed or modified between the above-listed dates, together with their metadata and EXIF tags;

19. Evidence or records of internet activity (including Internet Protocol addresses, firewall logs, transactions with Internet hosting providers, co-located computer systems, cloud computing services, caches, browser history and cookies, "bookmarked" or "favorite" web pages, search terms that the user entered into any Internet search engine, and records of user-typed web addresses) pertaining to distributing, receiving, possessing, storing, or viewing CSAM;

20. Evidence of software and counter-forensic programs or tools (and associated data) that are designed to eliminate data from a device;

21. Evidence of malware that would allow others to control the Subject Device(s) such as viruses, Trojan horses, and other forms of malicious software, as well as evidence of the presence or absence of security software designed to detect malware, as well as evidence of the lack of such malware;

22. Evidence of how and when the Suspect Device(s) was used or accessed to determine the chronological context of computer access, use, and events relating to the crime under investigation and to the device user;

23. Any other electronically stored information from the Subject Device(s) necessary to understand how the device was used, the purpose of its use, who used it, and when;

24. Passwords, encryption keys, and other access devices that may be necessary to access the Suspect Device(s);

25. Any other contextual information necessary to understand the evidence or information described above.

26. Law Enforcement Officers, to include examiners associated with the Intermountain West Regional Computer Forensic Laboratory (IWRCFL), the Utah Attorney General's

Office, the Federal Bureau of Investigations (FBI), Homeland Security Investigations (HSI), or other law enforcement agencies, are authorized to conduct on-scene forensic previews of all digital devices and such items that appear to contain evidence relevant to the crime(s) committed will be seized.

27. Law Enforcement Officers are authorized to submit the digital items located pursuant to the service of the search warrant to an examiner with specialized training in forensic programs for review, to include examiners associated with the IWRCFL, the Utah Attorney General's Office, FBI, HSI, and if necessary, submit the digital items located pursuant to the service of the search warrant to the IWRCFL, FBI, or HSI or other law enforcement agencies for further forensic analysis, which may include personnel inside or outside the State of Utah.

28. Law Enforcement Officers are authorized to compel the Subject Person(s) to unlock any devices that are subject to search or seizure pursuant to this warrant and that require biometric access. Law enforcement officers are NOT authorized to compel the Subject Person(s) to disclose passwords or passcodes to unlock such devices.

and that said property or evidence:

Was unlawfully acquired or is unlawfully possessed;

has been used or is possessed for the purpose of being used to commit or conceal the commission of an offense; or

is evidence of illegal conduct.

Affiant believes the property and evidence described above is evidence of the crime or crimes of Sexual Exploitation of a Minor- 76-5b-201.

The facts to establish the grounds for issuance of a Search Warrant are:

OFFICER TRAINING AND EXPERIENCE

I am currently assigned to the Special Victims Unit for the Utah County Sheriff's Office. I have been through the POST training academy and have been trained and certified as a Utah Peace Officer since April 2015, starting with Lehi Police Department for 6 years which consisted of approximately 3 years on patrol with another approximately 2 and a half years in the special victim's unit. I then moved to work for the Utah County Sheriff's Office and in my first 3 years there, I was assigned to the law enforcement patrol unit. In my time on patrol, I have investigated a wide variety of cases including DUI's, drugs, domestic violence, thefts, frauds, assaults, sex offenses, crimes against children as well as undercover work within the special victim's unit and as part of the FBI Child Exploitation Task Force. During my time as a police officer, I have been trained and certified as a drug recognition expert and have done dozens of drug evaluations. I have had several DUI arrests both involving alcohol and drugs.

While working for Lehi Police Department in the special victim's unit I worked crimes against children with an emphasis in online sex crimes. I was a task force officer with the FBI Child Exploitation Task force and started working with them in February 2018 through the rest of my time with Lehi PD. During that time, I have worked and been part of hundreds of arrests for online crimes against children. I have also been the lead detective

on several sex crimes, property crimes and all manner of crimes against people such as attempted homicide.

I am currently assigned to the Special Victims Unit (SVU) with the Utah County Sheriff's Office and am primarily assigned to work cybercrimes involving the sexual exploitation of minors. During my time as a sworn officer, I have investigated thousands of cases which have led to successful convictions in the court system. I have been trained as a forensic interviewer and have been to several interview and interrogation trainings and applied what has been taught in my investigations. As an SVU detective I have investigated several cases involving the sexual exploitation of children, online enticement of children and even homicide. In my current assignment I am investigating online crimes against children. I have also attended and completed the training at the ICAC bootstrap academy. I have since been approached by the FBI Child Exploitation Task Force and was reinstated as a Task Force officer with them. My experience in investigations has been refined and is continually improving as I further my career. I have also attended and completed the training at the ICAC bootstrap academy. I have since been approached by the FBI Child Exploitation Task Force and was reinstated as a Task Force officer with them. My experience in investigations has been refined and is continually improving as I further my career.

I have investigated, domestic violence cases, stalking cases, and many cases involved in threats both in person and online through emails, texts, and social media. I have investigated homicides, attempted murder, aggravated assault, electronic communication harassment and similar offenses. In my career, personal life, and experience, I have learned that people store a wide range of material on their cell phones. I have learned that when people are threatened, there is often a record of those threats on their phones. This record may take the form of screenshots of public or private communications like social media posts, cached websites, records of websites, social media, and other apps which show content accessed by the user, personal notes, emails, texts, and other communications which describe the threats the user has received to others like loved ones, associates and people who can help protect the threatened person.

I have investigated cases where surveillance footage has captured images of suspects, crimes, and evidence. Many businesses have video surveillance systems which have been helpful in identifying the facts of the cases I have investigated and the identities of witnesses and suspects.

The facts set forth in this Affidavit are based on my own personal knowledge, training, and experience; knowledge obtained from other individuals during my participation in this investigation, including other law enforcement officers and queries I have made to secure databases controlled by law enforcement agencies; and my review of records related to this investigation.

Because this Affidavit is submitted for the limited purpose of establishing probable cause in support of the application for a search warrant, it does not set forth each fact I or others have learned during this investigation. I have set forth only the facts I believe are relevant to the determination of probable cause to believe evidence, fruits, and instrumentalities of violations of the above-listed crime(s) will be found in or within the above listed locations.

DEFINITIONS

The following definitions apply to this affidavit:

a. “Child Pornography” as used in this affidavit includes both the definition of “child pornography” found in 18 U.S.C. § 2256(8) and the definition of “child sexual abuse materials” found in Utah Code § 76-5b-103(1).

18 U.S.C. § 2256(8) defines “child pornography” as “any visual depiction of sexually explicit conduct where (a) the production of the visual depiction involved the use of a minor engaged in sexually explicit conduct, (b) the visual depiction is a digital image, computer image, or computer-generated image that is, or is indistinguishable from, that of a minor engaged in sexually explicit conduct, or (c) the visual depiction has been created, adapted, or modified to appear that an identifiable minor is engaged in sexually explicit conduct.”

Utah Code § 76-5b-103(1) defines “child sexual abuse material” as “any visual depiction, including any live performance, photograph, film, video, picture, or computer or computer-generated image or picture, whether made or produced by electronic, mechanical, or other means, of sexually explicit conduct, where: (a) the production of the visual depiction involves the use of a minor engaging in sexually explicit conduct; (b) the visual depiction is of a minor engaging in sexually explicit conduct; or (c) the visual depiction has been created, adapted, or modified to appear that an identifiable minor is engaging in sexually explicit conduct.”

b. “Child Sexual Abuse Material” (“CSAM”): any use of the term “child sexual abuse material” or the acronym “CSAM” in this affidavit should be construed as a use of the term “child pornography” as defined in paragraph (a) above.

c. “Child erotica” means materials or items that are sexually arousing to persons having a sexual interest in children but that are not necessarily obscene or do not necessarily depict minors in sexually explicit poses or positions.

d. “Cloud-based storage service” refers to a publicly accessible, online storage provider that collectors of depictions of minors engaged in sexually explicit conduct can use to store and trade depictions of minors engaged in sexually explicit conduct in larger volumes. Users of such a service can grant access to their collections by sharing links, and associated passwords, to their stored files with other traders or collectors. Such services allow individuals to easily access these files through a wide variety of electronic devices such as desktop and laptop computers, mobile phones, and tablets, anywhere and at any time. An individual with the password to a file stored on a cloud-based service does not need to be a user of the service to access the file. Access is free and readily available to anyone who has an internet connection.

e. “Computer” means “an electronic, magnetic, optical, electrochemical, or other high-speed data processing device performing logical, arithmetic, or storage functions, and includes any data storage facility or communications facility directly related to or operating in conjunction with such device,” 18 U.S.C. § 1030(e)(1), and includes smartphones, mobile phones, tablets, and other portable devices.

f. “Electronic Service Provider” (“ESP”) means any provider of electronic communication services or remote computing services. As used herein, “Electronic Service Provider” includes all “Internet Service Providers.”

g. The “Internet” is a global network of computers and other electronic devices that

communicate with each other. Due to the structure of the Internet, connections between devices on the Internet often cross state and international borders, even when the devices communicating with each other are in the same state.

h. “Internet protocol” and “IP Address”:

“IP” stands for Internet Protocol. Internet Protocol provides the methodology for communication between devices on the Internet. An Internet Protocol address (“IP address”) is a unique number that identifies a device on a computer network and is used by computers to move information on the Internet. Every device directly connected to the Internet must have a unique IP address. The Internet Assigned Numbers Authority (IANA) manages the IP address space allocations globally.

Internet Protocol version 4 (IPv4) defines an IP address as a 32-bit number while Internet protocol version 6 (IPv6) defines an IP address as a 128-bit number. Both versions are currently in use on the internet. These IP addresses can be written and displayed in human-readable notations, such as 192.0.2.1 in IPv4 and 2001:db8:0:1234:0:567:8:1 in IPv6.

Dynamic vs Static IP addresses: A “dynamic” IP address means that the ESP assigns a different unique number to a device every time the device accesses the Internet. A “static” IP address means that the ESP assigns the same unique number to a device every time the device accesses the Internet. The frequency in which this address changes is generally controlled by the Internet Service Provider and not the user.

i. “Internet Service Providers” (“ISPs”) means commercial organizations, community-owned, non-profit, or otherwise privately controlled companies that are in business to provide individuals and businesses access to the Internet. ISPs provide a range of functions for their customers including access to the Internet, web hosting, e-mail, remote storage, and co-location of computers and other communications equipment.

j. “Minor” means any person under the age of eighteen years. See 18 U.S.C. § 2256(1).

k. “Records,” “documents,” and “materials,” each mean all information recorded in any form, visual or aural, and by any means, whether in handmade, photographic, mechanical, electrical, electronic, or magnetic form.

l. “Sexually explicit conduct” means actual or simulated (a) sexual intercourse, including genital-genital, oral-genital, anal-genital, or oral-anal, whether between persons of the same or opposite sex; (b) bestiality; (c) masturbation; (d) sadistic or masochistic abuse; or (e) lascivious exhibition of the genitals or pubic area of any person. See 18 U.S.C. §2256(2).

BACKGROUND

Based on my training and experience, and in collaboration with Internet Crimes Against Children (ICAC) investigators, ICAC prosecutors, industry experts, academia, and other law enforcement personnel, I know the following:

The Internet and Electronic Service Providers

a. The internet is a global network of computers and other electronic devices that communicate with each other.

b. Electronic Service Provider's (ESP's) provide a variety of services over the internet, including communication (including email, text, chat, social media, etc.), remote computing services, and cloud data storage.

c. When an ESP's customer logs onto the internet using a computer or another web-enabled device, they are assigned or "leased" an IP address. Due to the way IP addresses work, they are public and visible to others; in other words, the lessee has no expectation of privacy in them due to the public nature of IP addresses.

d. IP addresses are like a license plate on a car. They are the property of the issuer, and not the vehicle owner. Just as your license plate is visible as you cruise your city or town, your IP address is visible as you cruise the internet. Your IP address is visible to the administrators of websites you visit, attached to emails you send, and broadcast during most internet file and information exchanges that occur on the internet.

e. Most ESPs keep subscriber records relating to the IP addresses they assign to users, and that information is available to investigators. Typically, an investigator must submit legal process (e.g., subpoena or search warrant) requesting the subscriber information relating to a particular IP address at a specific date and time.

f. Many ESP's also monitor which devices are used to access their platform by recording the advertising identification number. This number is a unique identifier assigned to hardware devices used by ESPs to track users semi-anonymously and provide targeted advertisements. Because it is a unique identifier, this information can link specific devices owned by specific individuals with the criminal activity on a particular platform's account.

g. Most ESP's also keep records related to the means and sources of payment for services provided. This information may include account information such as billing address, name, phone number, email. It may also include transaction records, including date, time, amount, payee, location, card used, type of transaction, and any other data which the ESP retains about a specific transaction. Many ESPs also retain banking information such as connected bank accounts, connected credit and debit cards, and devices on which the subscriber, customer, or user has enabled those cards and accounts. These records can assist in identification of suspect(s) and the specific individuals who have engaged or are engaging in criminal activity on the ESP's platform.

h. A variety of publicly available websites provide a public query/response protocol that is widely used for querying databases to determine the registrant or assignee of internet resources, such as a domain name or an IP address block. These include WHOIS, MaxMind, arin.net, and other common search tools. WHOIS, MaxMind, and arin.net are commonly relied on by law enforcement and have proven reliable over many investigations by routinely providing verifiably accurate information.

The National Center for Missing and Exploited Children and CyberTipline Reports

i. The National Center for Missing and Exploited Children (NCMEC) is a private, non-profit organization established in 1984 by the United States Congress. Primarily funded by the Department of Justice (DOJ), NCMEC acts as an information clearinghouse and resource for parents, children, law enforcement agencies, schools, and communities to assist in locating missing children and to raise public awareness about ways to prevent child abduction, child sexual abuse, and depictions of minors engaged in sexually explicit conduct.

j. The NCMEC CyberTipline offers a means of reporting incidents of child sexual exploitation, including the possession, manufacture, or distribution CSAM; online enticement; child prostitution; child sex tourism; extra familial child sexual molestation; unsolicited obscene material sent to a child; and misleading domain names, words, or digital images.

k. Federal law requires NCMEC to operate the CyberTipline and requires ESPs to report apparent instances of CSAM offenses. Providers also have the discretion to submit reports concerning planned or imminent CSAM offenses.

l. Companies that suspect CSAM has been stored or transmitted on their systems or services report that information to NCMEC in a CyberTipline Report (or “CyberTip”). The ESP submits the report, which generally contains account and log-in information about the user, and uploads the suspect content to NCMEC via a secure connection. Aside from required information such as incident type, date, and time, ESPs can also fill in voluntary reporting fields such as user or account information, IP addresses, or information regarding the uploaded content itself, as well as other information it may have collected in connection with the suspected criminal activity.

m. ESPs may or may not independently view the content of the file(s) it uploads to NCMEC (see below). NCMEC does not review the content of these uploaded files.

n. NCMEC then uses publicly available search tools (including WHOIS, MaxMind, and arin.net), to attempt to locate where the suspected criminal activity occurred based on the information the ESP submitted. NCMEC then packages the information from the ESP along with any additional information it has, such as previous related CyberTips, and sends it to law enforcement in the jurisdiction where the activity is believed to have occurred.

ESPs and the Use of Hash Values and Hash Matching

o. ESPs routinely monitor their services utilized by their users/subscribers. Both to comply with federal law and to prevent their communication networks from serving as conduits for illicit activity and pursuant to the terms of user agreements, ESPs routinely and systematically attempt to identify suspected CSAM that may be sent through its facilities. Additionally, customer complaints may alert them that an image or video file being transmitted through their facilities likely contains suspected CSAM.

p. When an ESP receives such a complaint or other notice of suspected CSAM, they may employ a “graphic review analyst” or an equivalent employee to open and look at the image or video file to form an opinion as to whether what is depicted likely meets the federal criminal definition of depictions of minors engaged in sexually explicit conduct found in 18 U.S.C. § 2256. If the employee concludes that the file contains what appears to be CSAM, a hash value of the file can be generated by operation of a mathematical algorithm.

q. A hash value is an alphanumeric sequence that is unique to a specific digital file. Any identical copy of the file will have the same hash value as the original, but any alteration of the file, including even a change of one or two pixels, results in a different hash value. Consequently, an unknown image can be determined to be identical to an original file if it has the same hash value as the original. The hash value is, in essence, the unique fingerprint of that file, and when a match of the “fingerprint” occurs, the file also matches.

Several different algorithms are commonly used to hash-identify files, including Message Digest 5 (MD5) and Secure Hash Algorithm 1 (SHA-1).

Hash values are a very reliable method of authenticating files. It can be concluded with an extremely high degree of certainty that two files sharing the same hash value also share identical content. It is more likely that two humans would share the same biological DNA than for two files to share the same hash value. If even one bit (the smallest measure of data in a file) of a file is changed, the entire hash value of that file changes completely. As an example that demonstrates the uniqueness of a SHA-1 hash, the likelihood of two files having the same SHA-1 hash value is 2^{128} , or a 1-in-340,000,000,000,000,000,000,000,000,000,000,000,000,000,000,000,000 chance, while the likelihood of two humans having the same fingerprint is estimated to be 1-in-64,000,000,000. Harry Baker, Do Identical Twins Have Identical Fingerprints?, LiveScience (Aug. 7, 2021), <https://www.livescience.com/do-identical-twins-have-identical-fingerprints.html> (quoting Professor Simona Francese, PhD, a forensic scientist and fingerprint expert from Sheffield Hallam University in the United Kingdom).

A collision is when two different files have the same hash value. There have been no documented incidents of a collision involving SHA-1 hash values “in the wild” since its creation in 1995. There is, however, a reported collision involving two files sharing the same SHA-1 value in a lab setting. This was done purposely by engineers at Google in 2017 under controlled conditions for the sole purpose of creating this collision. Even with this knowledge in mind, the possibility of a suspected CSAM file reported in a CyberTip having the same hash value as an unrelated, non-criminal file is extremely unlikely. Hash value comparison is a highly reliable method of determining if two files are the same or different, and experts are confident that a confirmed hash match between two files is a forensic finding on a par with a DNA match or a fingerprint match.

Courts routinely rely upon hash matching in probable cause determinations.

r. ESPs typically maintain a database of hash values of the files that they have determined meet the federal definition of depictions of minors engaged in sexually explicit conduct found in 18 U.S.C. § 2256. ESPs typically do not maintain the actual suspect files themselves; once a file is determined to contain suspected depictions of minors engaged in sexually explicit conduct, and a hash value is generated, the file is deleted from their system.

s. ESPs can then use Image Detection and Filtering Process (“IDFP”), Photo DNA (pDNA), or a similar technology which compares the hash values of files embedded in or attached to communications on their network against their database containing the catalog of hash values of files that have previously been identified as containing suspected depictions of minors engaged in sexually explicit conduct.

t. When an ESP detects a file passing through its network has the same hash value as an image or video file that was previously determined to depict minors engaged in sexually explicit conduct, the ESP reports that fact to NCMEC via the latter’s CyberTipline. By statute, ESPs and ISPs have a duty to report to NCMEC any apparent depictions of minors engaged in sexually explicit conduct it discovers “as soon as reasonably possible.” 18 U.S.C. § 2258A(a)(1).

u. Because images previously determined to contain depictions of CSAM carry a known hash value, an ESP may flag and report images in a user account to NCMEC without also

contemporaneously reviewing the images. In this situation, the ESP's decision to report a file to NCMEC is made because the hash value of the reported image is identical to the hash value of the previously reviewed image depicting minors engaged in sexually explicit conduct.

Adults with Sexual Interest in Children

v. There are certain characteristics common to individuals involved in depictions of minors engaged in sexually explicit conduct.

w. Possessing, receiving, or attempting to receive depictions of minors engaged in sexually explicit conduct is an indication a person has sexual interest in minors.

x. Persons with a sexual interest in minors receive sexual gratification, stimulation, and satisfaction from actual physical contact with children; from fantasy involving the use of writings detailing physical contact with children; or from fantasy involving the use of pictures and videos of minors engaged in sexual activity or in sexually suggestive poses.

y. The development of the computer and internet has changed the way children are victimized and the way CSAM is produced, distributed, and maintained. It has become extraordinarily easy for child pornographers to produce, maintain/store, and distribute CSAM with varying levels of anonymity via the internet and electronic services.

z. It is increasingly common for people who use CSAM to obtain CSAM via correspondence or groups of similarly interested individuals on the internet. People who use CSAM will often correspond with others and share how and where to obtain CSAM or solicit and trade CSAM with each other. This is done through email, text messages, chats, applications, message boards, or forums.

aa. Additionally, individuals often retain CSAM on a device, or computer, or cloud-based storage account that they control and will sometimes maintain collections for several years because of the risks and difficulties involved in acquiring CSAM.

bb. In addition to the traditional collector, law enforcement has increasingly encountered offenders who obtain CSAM from the internet, view the contents, and subsequently delete the contraband, often after engaging in self-gratification. Due to technological advancements, increasing internet speeds, and worldwide availability of child sexual exploitative material, this phenomenon offers some offenders a sense of decreasing risk of being identified or apprehended with quantities of contraband. This type of consumer is commonly referred to as a "seek and delete" offender, knowing that the same or different contraband satisfying their interests remain easily discoverable and accessible online for future viewing and self-gratification.

Related Investigatory Background Information

cc. Individuals who search for, download, upload, and view files of child sexual abuse material (CSAM) use various electronic or online accounts in conjunction with those practice. These accounts contain current and historical information and data that is provided and or created through usage by the individual and this information can be used to possibly identify the individual accessing, saving, storing, transferring, disseminating, sharing, and viewing the illegal files and data.

dd. All that a computer user needs to do in order to use email, social media, or many other online services is open up an account with one of the myriad of companies that provide such services (e.g. Google [Gmail], Meta [Facebook, Instagram, Messenger], Snap, Microsoft, Yahoo etc.). Once the account is set up, the user can choose the “name” of account (i.e. of his email address, profile name, etc.). Most often, this chosen name does not have to match (or even relate to) identifying information of the user. Thus, the email address or profile name itself does not necessarily identify the owner of the account or the user of the service. Nevertheless, often the email messages, direct messages, posts, etc., themselves, contain information that either directly or indirectly identifies the user of the service.

Further, individuals involved in computer-related crimes often use e-mail accounts and social media services to conduct both criminal and non-criminal communications. Consequently, account data can be a great source of information to help identify the user of the services. The ability to view e-mails, messages, posts, and other account contents, by investigating law enforcement often provides further investigative leads to assist in identifying the person of interest

ee. Also due to the ease of setting up multiple accounts or services, individuals who use, obtain, or distribute CSAM will often create multiple accounts or use a variety of services at the same time to further their use of CSAM. Often this is done to obscure their identity from law enforcement or more easily categorize their collections according to the type of material or source. Obtaining information regarding all accounts or services, including internet services and cellular services, used by the account owner is necessary to show the breadth of illegal activity and to prove the identity of the account owner by eliminating innocent explanations.

ff. Additionally, individuals who use, obtain, or distribute CSAM through online accounts or services (including social media accounts) often create accounts with fake names and emails. They use the account until the company suspends it, or they delete it. Later, they create new names and emails to open a new account so they can view the CSAM. However, sometimes suspects will use true and accurate names, phone numbers, and accounts to be able to verify both suspect and legitimate accounts. Obtaining all information regarding accounts or services is necessary to prove the identity of the account owner.

gg. Some ESPs ask a user to verify a phone number or email during the account creation process. When a phone number or email address is verified by an ESP, it means that the user indicated that the phone/email belonged to them, the ESP sent a confirmation code or link to the phone/email, and the user correctly and in a timely manner re-entered that code into the ESP’s platform or clicked on the link, indicating their dominion and control over that phone/email account.

For example, if Google reported a suspect email address, suspect@gmail.com and the mobile phone number +18015551234, were “verified”. This suggests that Google sent an email to the suspect email address and that a link, or something similar, was verified by the owner of the email address so that Google would know the user was real. Something similar was done through the suspect's phone to “verify” it, perhaps with a push notification, a link, or a code. Verification is an indication that the email or phone number is being operated by a real individual. Use of a Utah area code can be an indication that the individual has ties to Utah.

hh. There are a variety of applications that are often used in conjunction with or as a type of the cloud storage service described above. The manner in which an account or device owner uses those services is valuable evidence to help investigators discover where a user stores their CSAM, a history of how an account owner has accessed CSAM, and the identity of the user accessing the CSAM. Additionally, many application providers keep logs of what external devices have been previously connected to the account. Evidence of other storage devices is important evidence to show where CSAM is located, how it was accessed, and who accessed it.

ii. Persons who use CSAM will sometimes solicit real children to produce CSAM or will contact children with the intent of acting out their sexual interest towards children. The extent to which the user of an account or a device has access to other children is relevant in understanding whether the user has previously sexually abused a child or whether the user has obtained CSAM from a child.

jj. Some of the data and information provided and gathered in the beginning of the investigation can and may lead to identifying some individuals associated with a specified location, it is not always clear who is accessing, saving, storing, transferring, disseminating, sharing, and viewing illegal data or what electronic devices have been used to access, save, store, transfer, disseminate, share, and view the illegal CSAM.

kk. It is common for people who are accused of using CSAM to claim that their accounts or devices were being used another person at the time the CSAM was used. A skilled forensic examiner can view how an application, device, or account was typically used to develop an understanding of the person who used the account. All information contained on an account or device, including information unrelated to the crime suspected is helpful in establishing the ownership, control, and use of an account or device by an owner. For instance, a user who regularly uses their account or device to conduct communication with family is likely to have a personal connection with that family. Location information stored on the account or device that conforms with the known daily routine of an individual can confirm the owner, possessor, or user of an account or device. Because the value of the information is highly case specific and has value as it fits into a larger picture, it is necessary for an investigator to consider all information as a whole. To establish a complete picture, an investigator must understand not only what other tasks were being performed by an account or device holder around the time of accessing the CSAM, but also whether those tasks are consistent with the historical use by the suspected account or device holder. Thus, all information available in or on the account or device must be examined by the investigator.

ll. It is also common for people who are accused of using CSAM to claim their account or device was 'hacked' or otherwise affected by unknown nefarious users. Information such as access logs, associated IP addresses, passwords, password changes, and all other associated information is useful in showing the control and use of the account or device by the account or device owner at the time the CSAM was used.

This information can also be used to exclude individuals who may not be involved in accessing, saving, storing, transferring, disseminating, sharing, and viewing the illegal data, by comparing information and data provided and received in the initial reports to the information and data from the associated electronic and online accounts

mm. Individuals who use CSAM also try and obfuscate data containing images and videos of minors engaged in sexual activity. One potential manner of trying to hide the contraband

may be by changing file extensions. For example, an image file may often have a file extension of “.jpg” or “.jpeg” signifying that it is an image file. An offender may change the file extension by selecting the “save as” format on a computer or digital device and selecting “.doc” or “.docx” to make it appear that instead of a contraband image or photograph, it is a text document. The same process may be used to attempt to hide a video file as well. Based on this known practice and other attempts to hide potential contraband it is necessary for forensic examiners to examine all potential data on a digital device and for an investigator to review all information or data associated with an electronic or online account.

nn. Regardless of whether an individual discards or collects depictions of minors engaged in sexually explicit conduct, evidence of such activity is likely to be found on computers and related devices, including storage media, and online accounts or services used by the person. This evidence may include the files themselves, logs of account access events, contact lists of others engaged in trafficking of depictions of minors engaged in sexually explicit conduct, backup files, and other electronic artifacts that may be recoverable.

Electronically Stored Information (ESI)

oo. Every type and kind of information, data, record, sound, or image can exist and be present as electronically stored information (ESI) on any of a variety of computers, computer systems, digital devices, and other electronic storage media. ESI evidence can be moved easily from one digital device to another. As a result, ESI evidence may be stored on any digital device present at the Subject Premises, or on the Subject Person(s), or in the Subject Vehicle(s) listed in this affidavit.

pp. ESI can be accessed or stored on any form of electronic or digital device capable of accessing the internet, including phones, computers, tablets, watches, and video gaming systems (i.e. Xbox, PlayStation, Nintendo Switch, etc.).

qq. Once created, ESI can be stored for years in very little space and at little or no cost. A great deal of ESI is created, and stored, without a conscious act on the part of the device operator. For example, files that have been viewed via the Internet are sometimes automatically downloaded into a temporary Internet directory or “cache,” without the knowledge of the device user. The browser often maintains a fixed amount of hard drive space devoted to these files, and the files are only overwritten as they are replaced with more recently viewed Internet pages or if a user takes affirmative steps to delete them. This ESI may include relevant and significant evidence regarding criminal activities, but also, and just as importantly, may include evidence of the identity of the device user, and when and how the device was used. Most often, some affirmative action is necessary to delete ESI. And even when such action has been deliberately taken, ESI can often be recovered, months or even years later, using forensic tools.

rr. Wholly apart from data created directly (or indirectly) by user-generated files, digital devices - in particular, a computer’s internal hard drive - contain electronic evidence of how a digital device has been used, what it has been used for, and who has used it. This evidence can take the form of operating system configurations, artifacts from operating systems or application operations, file system data structures, and virtual memory “swap” or paging files. Computer users typically do not erase or delete this evidence, because special software is typically required for that task. However, it is technically possible for a user to use such specialized software to delete this type of information, and the use of such special software may itself result in ESI that is relevant to the criminal investigation. To

properly retrieve and analyze electronically stored (computer) data, and to ensure accuracy and completeness of such data and to prevent loss of the data either from accidental or programmed destruction, it is necessary to conduct a forensic examination of the computers. To affect such accuracy and completeness, it may also be necessary to analyze not only data storage devices, but also peripheral devices which may be interdependent, the software to operate them, and related instruction manuals containing directions concerning operation of the computer and software. The search of the peripheral devices and instruction manuals may provide evidence of user attribution of the digital devices and provide identifying information as to the individual responsible for the contraband items.

ss. A computer's, or digital device's, capability to store images in digital form makes it an ideal repository for depictions of minors engaged in sexually explicit conduct. The storage capacity of the electronic storage media (commonly referred to as a "hard drive") used in home computers has grown tremendously within the last several years, even while the physical sizes of storage drives used in mobile digital devices has shrunk. Hard drives with capacity exceeding 1 terabyte are not uncommon. These drives can store thousands of images at very high resolution. Magnetic storage located in host computers adds another dimension to the equation. It is possible to use a video camera to capture an image, process that image in a computer with a video capture board and save that image to storage elsewhere. Once this is done, there is no readily apparent evidence at the "scene of the crime." Only with careful laboratory examination of all electronic storage devices is it possible to recreate the evidence trail.

Search & Seizure of Digital Devices

tt. The physical size of digital devices, including external storage devices, has shrunk to diminutive proportions. For example, there now exist SD cards as small as a human fingernail. Such digital devices can be easily hidden.

uu. Individuals who use or access CSAM are aware of the illegal nature of the data and often hide or hold the devices used to access the data in places reasonably private, but also readily accessible. This includes closets, safes, lock boxes, cars, out buildings, etc.

vv. Individuals who use or access CSAM will sometimes use their personal smart phone to use or access CSAM. Such individuals often have that phone on their person. Additionally, due to the increasingly diminutive size of external storage devices, individuals may conceal such devices on their person to prevent inadvertent discovery by others.

ww. As a result of the forgoing, digital devices could be easily hidden or found anywhere at the Subject Premises, or on the Subject Person(s), or in the Subject Vehicle(s) listed in this affidavit.

xx. In most cases it is impossible to successfully conduct a complete, accurate, and reliable search for electronic evidence stored on a digital device during the physical search of a search site for a number of reasons, including but not limited to the following:

- a. Technical Requirements
- b. Volume of Evidence
- c. Search Techniques

yy. Despite the inability to conduct a complete search for electronic evidence stored on a digital device during the physical search of the search site, a preliminary on scene forensic

preview can assist officers in determining whether a particular device that appear to contain evidence relevant to the crime(s) committed.

zz. If, after conducting its preliminary examination or a later more thorough examination, law enforcement personnel determine that any digital device is an instrumentality of the criminal offenses referenced above, the law enforcement may retain that device during the pendency of the case as necessary to, among other things, preserve the instrumentality evidence for trial, ensure the chain of custody, and litigate the issue of forfeiture. If law enforcement personnel determine that a device was not an instrumentality of the criminal offenses referenced above, it shall be returned to the person/entity from whom it was seized.

aaa. If, after conducting its examination, law enforcement personnel determine that any digital device is an instrumentality of the criminal offenses referenced above, law enforcement may retain that device during the pendency of the case as necessary to, among other things, preserve the instrumentality evidence for trial, ensure the chain of custody, and litigate the issue of forfeiture.

Biometric Unlocking of Encountered Devices

bbb. Many electronic devices, particularly newer mobile devices and laptops, offer their users the ability to unlock the device through biometric features in lieu of a numeric or alphanumeric passcode or password. These biometric features include fingerprint scanners, facial recognition features, and iris recognition features. Some devices offer a combination of these biometric features, and the user of such devices can select which features they would like to utilize.

ccc. If a device is equipped with a fingerprint scanner, a user may enable the ability to unlock the device through his or her fingerprints. For example, Apple offers a feature called "Touch ID," which allows a user to register up to five fingerprints that can unlock a device. Once a fingerprint is registered, a user can unlock the device by pressing the relevant finger to the device's Touch ID sensor, which is found in the round button (often referred to as the "home" button) located at the bottom center of the front of the device. The fingerprint sensors found on devices produced by other manufacturers have different names but operate similarly to Touch ID.

ddd. If a device is equipped with a facial-recognition feature, a user may enable the ability to unlock the device through his or her face. For example, this feature is available on certain Android devices and is called "Trusted Face." During the Trusted Face registration process, the user holds the device in front of his or her face. The device's front-facing camera then analyzes and records data based on the user's facial characteristics. The device can then be unlocked if the front-facing camera detects a face with characteristics that match those of the registered face. Facial recognition features found on devices produced by other manufacturers have different names but operate similarly to Trusted Face.

eee. If a device is equipped with an iris-recognition feature, a user may enable the ability to unlock the device with his or her irises. For example, on certain Microsoft devices, this feature is called "Windows Hello." During the Windows Hello registration, a user registers his or her irises by holding the device in front of his or her face. The device then directs an infrared light toward the user's face and activates an infrared-sensitive camera to record data based on patterns within the user's irises. The device can then be unlocked if the infrared-sensitive camera detects the registered irises. Iris-recognition features found on

devices produced by other manufacturers have different names but operate similarly to Windows Hello.

fff. Users of electronic devices often enable the biometric features because they are considered to be a more convenient way to unlock a device than by entering a numeric or alphanumeric passcode or password. Moreover, in some instances, biometric features are considered to be a more secure way to protect a device's contents. This is particularly true when the users of a device are engaged in criminal activities and thus have a heightened concern about securing the contents of a device.

ggg. As discussed in this Affidavit, your Affiant has reason to believe that one or more digital devices will be found during the search. The passcode or password that would unlock the devices subject to search under this warrant currently is not known to law enforcement. Thus, law enforcement personnel may not otherwise be able to access the data contained within the devices, making the use of biometric features necessary to the execution of the search authorized by this warrant.

hhh. Biometric features will not unlock a device in some circumstances even if such features are enabled. This can occur when a device has been restarted, inactive, or has not been unlocked for a certain period of time. Biometric features from other brands carry similar restrictions. Thus, in the event law enforcement personnel encounter a locked device equipped with biometric features, the opportunity to unlock the device through a biometric feature may exist for only a short time.

iii. Due to the foregoing, if law enforcement personnel encounter any devices that are subject to seizure pursuant to this warrant and may be unlocked using one of the aforementioned biometric features, this warrant permits law enforcement personnel to:

(1) press or swipe the fingers (including thumbs) of Subject Person to the fingerprint scanner of the devices found at the Subject Premises, or on the Subject Person(s), or in the Subject Vehicle(s);

(2) hold the devices found at the Subject Premises, or on the Subject Person(s), or in the Subject Vehicle(s), in front of the face of the Subject Person(s) and activate the facial recognition feature; and/or

(3) hold the devices found at the Subject Premises, or on the Subject Person(s), or in the Subject Vehicle(s), in front of the face of the Subject Person(s) and activate the iris recognition feature, for the purpose of attempting to unlock the devices in order to search the contents as authorized by this warrant.

The proposed warrant does not authorize law enforcement to compel Subject Person(s) to state or otherwise provide the password or any other means that may be used to unlock or access the devices. Moreover, the proposed warrant does not authorize law enforcement to compel Subject Person(s) to identify the specific biometric characteristics (including the unique finger(s) or other physical features) that may be used to unlock or access the devices.

THE INVESTIGATION

On 09/10/2025 Charles Kirk was speaking at the Utah Valley University Campus located in the UVU Courtyard. During the event while speaking, a loud bang was heard. At this time Charles was struck in the neck from a bullet fired by an individual who was later identified as Tyler Robinson. At the time of the shooting officers did not know where the

bullet was fired from or where the suspect was located. As they scanned the area looking for the suspect, a 71 year-old male named George Zinn approached UVU police officers stating "I shot him shoot me." The male was quickly taken into custody and a search incident to arrest showed that he did not have a firearm on his person. HE was asked hwere the gun was and George stated "I am not going to tell you where it is". The male again stated, "I shot him now shoot me". The male was transported out of the area back to the UVU police department. As this was happening, officers were searhing the immediate area were George approached police in search of a firearm that did not exist, pulling resources from the search for the actual shooter who had now escaped the area. George was told at one point that his actions drew officers attention to him and pulled resources away from finding the actual shooter. George responded by saying "Well good, that was my plan to help him get away."

FBI Agent Steve Hyman and SBI Agent Justin Hansen responded to the hospital where George was transported to and conducted an interview with him. Geroage was read his miranda warning and interviewed. In this interview George admitted that he was not the shooter. Towards the end of the interview the agents asked to go into his phone and George allowed them. The agents asked if there would be anything illegal in the phone and George mentioned that he uses that phone to look at child sexual abuse material (CSAM) and that would be on the phone. The agents sat with George briefly and looked through some of the phones contents with George. The photos folder contained images of prepubescent female children aroun the age of 5 years old. The children were dressed in underwear. George told investigators that he was sexually arroused by children ranging in age from 5 to 12 years-old . Due to the events at the time and the shooter still at large, the phone was seized and the interview terminated shortly after and a referral was made to the Utah County Sheriff's Office. George admitted to there being CSAM on the phone and stated that he would often delete it becasue he knows that he could get in trouble for it.

Based on the aforementioned information, I submit that there is probable cause to believe that Geroage Zinn has CSAM on his phone. George stated that he looks at CSAM regularly and deletes it later. In a quick preview images of prepubescent children were located on his phone coorborating his admission of attraction to chidren. The phone may also contain perishable evidence as photos and videos that are deleted on a phone often have a limited number of days untill the phone perminately dletes it to the point extranction tools may not be able to recover the data. I ask that a warrant be approved to prevent the loss of evidence contained on Georges cellphone, which is a Moto g play with the serial number ZY22JC2M33 which is currently in possession of the Utah County Sheriff's Office.

WHEREFORE, your affiant prays that a Search Warrant be issued for the seizure of said items in the daytime.

APPLICATION TO SEAL SEARCH WARRANT AND RELATED DOCUMENTS:

Your Affiant requests, pursuant to Utah Rule of Crim. P. 40(m) that the search warrant, application, and affidavit or other recorded testimony upon which the warrant is based, to include this application for an order sealing such documents, be SEALED until 03/15/2026 for the following reasons:

- pose a serious impediment to the investigation;

This is an on-going investigation and sealing this search warrant will greatly help to preserve the integrity of the investigation.

I declare under criminal penalty of the State of Utah that the foregoing is true and correct.

Executed on: 15th day of September, 2025 @ 01:51 PM by /s/ MICHAEL GEORGE CARLE

IN THE FOURTH DISTRICT COURT - ALL DEPARTMENT
IN AND FOR UTAH COUNTY, STATE OF UTAH

SEARCH WARRANT

No. 3215171

COUNTY OF UTAH, STATE OF UTAH

To any peace officer in the State of Utah:

Proof by Affidavit made upon oath or written affirmation subscribed under criminal penalty of the State of Utah having been made to me by Detective MICHAEL GEORGE CARLE of Utah County Sheriff's Office, this day, I am satisfied that there is probable cause to believe

THAT

On the item(s) described as:

Moto G play, serial #ZY22JCM33 belonging to George Zinn DOB 04/03/1954.

In the City of Provo, County of Utah, State of Utah, there is now certain property or evidence described as:

1. Images or visual depictions of child sexual abuse material (CSAM);
2. Images or depictions, whether written or visual, of child erotica;
3. Electronic information (including notes, software, documents, records, or correspondence, in any format and medium) pertaining to CSAM, child erotica, sexual activity with minors, attempts to have sexual activity with minors, or sexual interest in minors;
4. Electronic information (including notes, software, documents, records, or correspondence, in any format and medium) pertaining to any minor who is, or appears to be, the subject of any visual depiction of CSAM, child erotica, sexual activity with other minors or adults, or sexual interest, including any information that may be helpful in identifying such minors;
5. Evidence of the identity of the person in possession of the Subject Device(s) on or about any times that items of evidentiary value (including user attribution evidence), located pursuant to this warrant, were created modified, accessed, or otherwise manipulated. Such evidence may be found in digital communications, photos and video and associated metadata, documents, social media activity, and/or electronically stored information from

the device necessary to understand how the device was used, the purpose of its use, who used it, and when;

6. Electronic information (including documents, records, photos, videos, or correspondence, in any format and medium) that pertain to use or ownership of the Subject Device(s), or that aid in the identification of persons involved in distributing, receiving, possessing, storing, or viewing CSAM;

7. Evidence of when and where the Subject Device(s) was used, including descriptions of time, date, locations, items, or events, that show or tend to show the commission by a particular person of, or connect or tend to connect a particular person to, distributing, receiving, possessing, storing, or viewing CSAM;

8. Evidence of who used, owned, or controlled the Subject Device(s) to commit or facilitate the commission of the crimes described, or at the time the things described in this warrant were created, edited, or deleted [including photographs, videos, logs, call logs, phonebooks, address books, contacts, IP addresses, registry entries, configuration files, saved usernames and passwords, documents, calendars, browsing history, search terms, metadata, user profiles, e-mail, e-mail contacts, messages (text or voice), instant messaging logs, file structure and correspondence];

9. Evidence of other accounts associated with the Subject Device(s) including email addresses, social media accounts, messaging “app” accounts, online storage accounts, and other accounts that may be accessed through the device that will aid in determining the possessor/user of the device;

10. Electronic information (including records, documents, invoices, materials, in any format and medium) that concern usernames, email addresses, e-mail accounts, other online accounts, online storage, or other remote computer storage pertaining to distributing, receiving, possessing, storing, or viewing CSAM.

11. Evidence of the attachment to the Subject Device(s) of other storage devices or similar containers for electronic or digital evidence; and/or evidence that the Subject Device(s) was attached to any other device(s);

12. Evidence of use of the Subject Device(s) to communicate with other individuals with a sexualized interest in minors or others about the crime(s) listed below, via incoming or outgoing calls, chat sessions, instant messages, text messages, app communications, social media, SMS communications, or other similar digital communications related to the sexual abuse of a minor or the possession or production of depictions of minors engaged in sexually explicit conduct;

13. Electronic information (including address books, names, addresses, phone logs, and text logs, in any format and medium) of individuals who may have been contacted by use of the Subject Device(s) or by other means for the purpose of distributing, receiving, possessing, storing, or viewing CSAM;

14. Electronic information (including notes, software, documents, records, or correspondence, in any format and medium) concerning membership in online groups, clubs, or services that provide or make accessible CSAM, or offer children for sexual encounters;

15. Electronic information (including records, documents, invoices and materials, in any format and medium) that concern any accounts with an Internet Service Provider or Cellular Telephone Service pertaining to distributing, receiving, possessing, storing, or viewing CSAM;
16. Credit card information, bills, and payment records on subjects device pertaining to distributing, receiving, possessing, storing, or viewing CSAM;
17. Information regarding the telephone number associated with any seized phone(s), its service provider and all data used by a service provider to identify the phone, including the phone's IMED, ESN or other serial number, MAC address, and other unique identifiers;
18. Information that can be used to calculate the position of any seized phone during the date range of 9/10/2024-09/10/2025, including location data; cell tower usage; GPS satellite data; GPS coordinates for routes and destination queries between the above-listed dates; "app" data or usage information and related location information; and images created, accessed or modified between the above-listed dates, together with their metadata and EXIF tags;
19. Evidence or records of internet activity (including Internet Protocol addresses, firewall logs, transactions with Internet hosting providers, co-located computer systems, cloud computing services, caches, browser history and cookies, "bookmarked" or "favorite" web pages, search terms that the user entered into any Internet search engine, and records of user-typed web addresses) pertaining to distributing, receiving, possessing, storing, or viewing CSAM;
20. Evidence of software and counter-forensic programs or tools (and associated data) that are designed to eliminate data from a device;
21. Evidence of malware that would allow others to control the Subject Device(s) such as viruses, Trojan horses, and other forms of malicious software, as well as evidence of the presence or absence of security software designed to detect malware, as well as evidence of the lack of such malware;
22. Evidence of how and when the Suspect Device(s) was used or accessed to determine the chronological context of computer access, use, and events relating to the crime under investigation and to the device user;
23. Any other electronically stored information from the Subject Device(s) necessary to understand how the device was used, the purpose of its use, who used it, and when;
24. Passwords, encryption keys, and other access devices that may be necessary to access the Suspect Device(s);
25. Any other contextual information necessary to understand the evidence or information described above.
26. Law Enforcement Officers, to include examiners associated with the Intermountain West Regional Computer Forensic Laboratory (IWRCFL), the Utah Attorney General's Office, the Federal Bureau of Investigations (FBI), Homeland Security Investigations (HSI), or other law enforcement agencies, are authorized to conduct on-scene forensic previews of all digital devices and such items that appear to contain evidence relevant to

the crime(s) committed will be seized.

27. Law Enforcement Officers are authorized to submit the digital items located pursuant to the service of the search warrant to an examiner with specialized training in forensic programs for review, to include examiners associated with the IWRCFL, the Utah Attorney General's Office, FBI, HSI, and if necessary, submit the digital items located pursuant to the service of the search warrant to the IWRCFL, FBI, or HSI or other law enforcement agencies for further forensic analysis, which may include personnel inside or outside the State of Utah.

28. Law Enforcement Officers are authorized to compel the Subject Person(s) to unlock any devices that are subject to search or seizure pursuant to this warrant and that require biometric access. Law enforcement officers are NOT authorized to compel the Subject Person(s) to disclose passwords or passcodes to unlock such devices.

and that said property or evidence:

Was unlawfully acquired or is unlawfully possessed;

has been used or is possessed for the purpose of being used to commit or conceal the commission of an offense; or

is evidence of illegal conduct.

Affiant believes the property and evidence described above is evidence of the crime or crimes of Sexual Exploitation of a Minor- 76-5b-201.

YOU ARE THEREFORE COMMANDED:

to make a search in the daytime of the above-named or described person, vehicle, item, and/or premises for the herein-above described property or evidence and if you find the same or any part thereof, retain such property in your custody subject to the direction of a prosecutor or an order of this Court.

ORDER TO SEAL

Based upon the Application to Seal in the accompanying Affidavit in Support of Search Warrant, IT IS HERBY ORDERED that that the search warrant, application, and affidavit or other recorded testimony upon which this search warrant is based, to include the application for an order sealing such documents, is SEALED until 03/15/2026.

Dated: 15th day of September, 2025 @ 02:00 PM /s/

SEAN PETERSEN
District Court Judge

RETURN TO SEARCH WARRANT

NO. 3215171

The personal property listed below or set out on the inventory attached hereto was taken from the person of Moto G play, serial #ZY22JCM33 belonging to George Zinn,, by virtue of a search warrant dated the 15th day of September, 2025, and issued by Magistrate SEAN PETERSEN of the FOURTH DISTRICT COURT - ALL DEPARTMENT:

Forensic extraction.

I, Detective MICHAEL GEORGE CARLE of Utah County Sheriff's Office, by whom this warrant was executed, do swear that the above listed or below attached inventory contains a true and detailed account of all the property taken by me under the warrant, on the 15th day of September, 2025.

All of the property taken by virtue of said warrant will be retained in my custody subject to the order of this Court or of any other court in which the offense in respect to which the property, or things taken, is triable.

I declare under criminal penalty of the State of Utah that the foregoing is true and correct.

Executed on: 22nd day of October, 2025 @ 08:32 AM by /s/ MICHAEL GEORGE CARLE
